

# Agilent E4428C ESG Analog Signal Generator

Data sheet

All specifications apply over a 0 to 55 °C range (unless otherwise stated) and apply after a 45 minute warm-up time. Supplemental characteristics, denoted as typical, nominal, or measured, provide additional (non-warranted) information at 25 °C, which may be useful in the application of the product.

## Definitions

**Specifications:** Represents warranted performance.

**Typical:** Represents characteristic performance which is non-warranted. Describes performance that will be met by a minimum of 80% of all products. All typical values are indicated by parenthesis.

**Nominal:** Represents characteristic performance which is non-warranted. Represents the value of a parameter that is most likely to occur; the expected mean or average.

**Measured:** Represents characteristic performance which is non-warranted. Represents the value of a parameter measured on an instrument during design stage.

# Key Features

## Key standard features

---

- Industry-leading spectral purity
- Superior level accuracy
- High output power
- High-stability timebase
- Wideband FM and  $\Phi$ M
- Excellent modulation accuracy and stability
- Step and list sweep, both frequency and power
- Built-in function generator
- Lightweight, rack-mountable
- 2-year calibration cycle

## Optional performance

---

- Option 503, frequency range from 250 kHz to 3 GHz (electronic attenuator standard)
  - Option 506, frequency range from 250 kHz to 6 GHz (mechanical attenuator only)
  - Option UNB, higher output with mechanical attenuator
- Note:** Option 506 is standard with the high power mechanical attenuator used in Option UNB, and therefore, both options cannot be ordered together.*
- Option 1EM, move all front panel connectors to rear panel
-

## Repeatability and linearity

**Repeatability** measures the ability of the instrument to return to a given power setting after a random excursion to any other frequency and power setting. It is a relative measurement that reflects the difference in dB between the maximum and minimum power readings for a given setting over a specific time interval. It should not be confused with absolute power accuracy, which is measured in dBm.<sup>1</sup>

**Relative level accuracy** measures the accuracy of a step change from any power level to any other power level. This is useful for large changes (i.e. 5 dB steps).<sup>1</sup>

1. Repeatability and relative level accuracy are typical for all frequency ranges.

# Specifications for Frequency and Power

Linearity measures the accuracy of small changes while the attenuator is held in a steady state (to avoid power glitches). This is useful for fine resolution changes.<sup>1</sup>

1. Repeatability and relative level accuracy are typical for all frequency ranges.

<b>Dual sinewave mode</b>	
Frequency range	0.1 Hz to 100 kHz
Amplitude ratio	0 to 100%
Amplitude ratio resolution	0.1%
<b>LF audio out mode</b>	
Amplitude	0 to 2.5 V <sub>peak</sub> into 50 Ω
Output impedance	50 Ω nominal
<b>Noise</b>	Noise with adjustable amplitude generated as a peak-to-peak value (RMS value is approximately 80% of displayed value)

### External modulation inputs

<b>Modulation types</b>	
Ext 1	FM, ØM, AM, pulse
Ext 2	FM, ØM, AM, and pulse
High/Low Indicator [100 Hz to 10 MHz BW, AC coupled inputs only]. Activated when input level error exceeds 3% [nominal].	

# Specifications for Analog Modulation

## Composite modulation

---

AM, FM, and  $\emptyset$ M each consist of two modulation paths which are summed internally for composite modulation. The modulation sources may be any two of the following: Internal, External 1, External 2.

---

## Simultaneous modulation

---

Multiple modulation types may be simultaneously enabled. For example, AM, and FM can run concurrently and all will affect the output RF. This is useful for simulating signal impairments. There are some exceptions: FM and  $\emptyset$ M cannot be combined. Two modulation types cannot be generated simultaneously by the same modulation source.

## Accessories

Transit case	Part number 9211-1296
<b>Inputs and outputs</b> All front panel connectors can be moved to rear with Option 1EM.	
10 MHz input	Accepts a 1, 2, 5, or 10 MHz $\pm 0.2$ ppm. Nominal input level $-3.5$ to $+20$ dBm, impedance 50 ohms. [BNC, rear panel]
10 MHz output	Outputs the 10 MHz reference signal. Level nominally $+3.9$ dBm $\pm 2$ dB. Nominal output impedance 50 ohms. [BNC, rear panel]
External 1 input	This BNC input connector accepts a $\pm 1 V_{\text{peak}}$ signal for AM, FM, pulse, and phase modulation. For all these modulations, $\pm 1 V_{\text{peak}}$ produces the indicated deviation or depth. When ac-coupled inputs are selected for AM, FM, or phase modulation and the peak input voltage differs from $1 V_{\text{peak}}$ by more than 3%, the hi/lo annunciator light on the display. The input impedance is 50 ohms and the damage levels are $5 V_{\text{rms}}$ and $10 V_{\text{peak}}$ . If you configure your signal generator with Option 1EM, this input is relocated to a female BNC connector on the rear panel.
External 2 input	This BNC input connector accepts a $\pm 1 V_{\text{peak}}$ signal for AM, FM, phase modulation, and pulse modulation. With AM, FM, or phase modulation, $\pm 1 V_{\text{peak}}$ produces the indicated deviation or depth. With pulse modulation, $+1 V$ is on and $0 V$ is off. When ac-coupled inputs are selected for AM, FM, or phase modulation, and the peak voltage differs from $1 V_{\text{peak}}$ by more than 3%, the hi/lo annunciator light on the display. The input impedance is 50 ohms and the damage levels are $5 V_{\text{rms}}$ and $10 V_{\text{peak}}$ . If you configure your signal generator with Option 1EM, this input is relocated to a female BNC connector on the rear panel.
GPIB	Allows communication with compatible devices. [rear panel]
LF output	Outputs the internally-generated LF source. Outputs 0 to $2.5 V_{\text{peak}}$ into 50 ohms, or 0 to $5 V_{\text{peak}}$ into high impedance. [BNC, front panel]
RF output	Nominal output impedance 50 ohms. [type-N female, front panel]
Sweep output	Generates output voltage, 0 to $+10 V$ when signal generator is sweeping. Output impedance $< 1$ ohm, can drive 2000 ohms. [BNC, rear panel]
Trigger input	Accepts CMOS <sup>1</sup> signal for triggering point-to-point in manual sweep mode, or to trigger start of LF sweep. The damage levels are $-0.5$ to $+5.5 V$ . [BNC, rear panel]
Trigger output	Outputs a TTL signal: high at start of dwell, or when waiting for point trigger in manual sweep mode; low when dwell is over or point trigger is received, high or low $2 \mu\text{s}$ pulse at start of LF sweep. [BNC, rear panel]

1. Rear panel inputs and outputs are 3.3 V CMOS, unless indicated otherwise. CMOS inputs will accept 5 V CMOS, 3 V CMOS, or TTL voltage levels.

## LAN connector

LAN communication is supported by the signal generator via the LAN connector. It is functionally equivalent to the GPIB connector. The LAN connector enables the signal generator to be remotely programmed by a LAN-connected computer. The distance between a computer and the signal generator is limited to 100 meters [10BaseT]. For more information about the LAN, refer to the *Getting Started* chapter in the *Programming Guide*.

### Data transfer speeds

LAN [FTP]	file transfer to volatile memory	(700 KB/sec)
	to hard drive	(500 KB/sec)
LAN [SCPI]	command transfer to volatile memory	(146 KB/sec)
	to hard drive	(128 KB/sec)
Internal file transfer from hard drive to volatile memory		(1280 KB/sec)

## RS-232 connector

This male DB-9 connector is an RS-232 serial port that can be used for controlling the signal generator remotely. It is functionally equivalent to the GPIB connector. The following table shows the description of the pinouts. The pin configuration is shown below.

Pin number	Signal description	Signal name
1	No connection	
2	Receive data	RECV
3	Transmit data	XMIT
4	+5 V	
5	Ground, 0 V	
6	No connection	
7	Request to send	RTS
8	Clear to send	CTS
9	No connection
