

Real-Time Spectrum Analyzers

► RSA3300A Series

Trigger, Capture, Analyze Your RF Signal

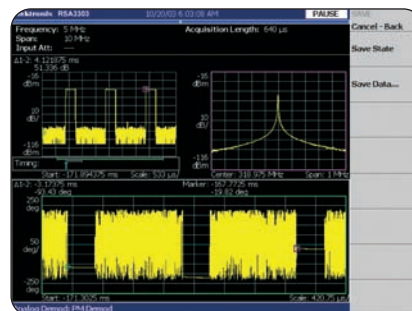

Quickly Solve Design, Production or Operational Problems with Comprehensive Characterization of Time-varying and Transient RF Signals

Define issues and solve problems faster by characterizing your device, system or signal more completely and rapidly than previously possible with swept spectrum analyzers. Tektronix RSA3300A Series Real-Time Spectrum Analyzers capture many signals not viewable on swept spectrum analyzers by seamlessly capturing and storing a span of RF frequencies all at one time.*1 Once a signal is captured it can be viewed simultaneously and analyzed in time-correlated frequency, time and modulation domains. RSA Series instruments include not only Real-Time Spectrum Analyzer fast-signal capture, internal memory and modulation analysis but also functionality and operation of a swept spectrum analyzer for looking at very wide spans, all in an integrated, transportable package.

*1 See Tektronix Real-Time Spectrum Analysis Technical Brief (Lit # 37W-17252) for an explanation of how RTSA works and its unique capabilities:
http://www.tek.com/Masurement/App_Notes/37_17252/eng/

- RSA Series Spectrogram uniquely shows time-varying signal behavior in frequency change/stability, spectrum occupancy, pulsed signal timing, power change and more! The sample on this page shows the frequency settling characteristic of a transmitting device.

- Time-correlated multi-domain view provides a new level of insight about design or operational problems and possible solutions. The example on this page includes frequency, time and modulation domain views of an AM-modulated pulsed signal with pulse-to-pulse phase variation measured in the modulation domain.

► Features & Benefits

Real-Time Spectrum Analysis Provides Seamless Capture of Time-varying, Transient or Periodic RF Signals Not Possible with Swept Spectrum Analyzers

Up to 65.536 Ms (256 MB) of Internal Memory Provides for Complete Analysis of Signals Over Time Without Making Multiple Measurements

Time-correlated, Simultaneous Views of Time, Frequency and Modulation Domains Provide Greater and Unique Understanding of Signal Behavior

Spectrogram Provides a Revealing Picture of RF Signal Frequency and Amplitude Behavior Over Time – Not Possible with a Swept Spectrum Analyzer

Frequency Mask Trigger – Available Only from Tektronix – Makes It Easy to Capture Fast, Transient or Intermittent Signals that Swept Spectrum Analyzers Would Miss

Spectrum Analyzer Mode for Very Wide Span Analyses

Built-in Demodulators Enhance Analysis of AM, ASK, FM, FSK and PM Signals

Digital Demodulator Offers Affordable Vector Signal Analysis

Outstanding DC – 20 MHz Dynamic Range and Low Phase Noise Mean You Can Make High-performance Weak Signal and Phase Noise Measurements

► Applications

Analog and Digital Modulation Signal Quality Analysis

Understanding Frequency and Spectral Occupancy Behavior Over Time

Capture and Characterization of Undesired, Unknown or Interfering Signals

Device/system Design or Operational Diagnostic Measurement

Getting Answers to Elusive EMI Problems

Real-Time Spectrum Analyzers

► RSA3300A Series

Trigger, Capture, Analyze

You Can Easily Catch an Elusive RF Signal and Analyze It at Your Convenience

Sensitive and fast, RSA Series Real-Time Spectrum Analyzer triggering easily captures unknown, periodic or intermittent signals. Using the Tektronix exclusive Frequency Mask Trigger, you can configure a custom frequency domain

mask including signal guard bands and levels then trigger on events isolated to a specific frequency or frequency range. As signals are captured, they are automatically saved to RSA internal memory, making it easy to perform in-depth, time-correlated analysis across the frequency, time and modulation domains with no external computer required! Quick-to-set-up IF Level and Power (Span Bandwidth)

triggers provide very convenient capture of signals in applications such as incident carrier-and-response interaction between two devices or burst signal carrier ramp up. Continuous Trigger Mode ensures a sequence of events are automatically captured into memory; you capture only the events and not time in between, maximizing memory efficiency and minimizing analysis time.

Spurious Responses

Third Order Intermodulation Distortion –

100 MHz to 3 GHz:

RSA3303A, RSA3308A: <-74 dBc (Ref Level = +5 dBm, RF Att. = 20 dB, total signal power = -7 dBm, signal separation 300 kHz).

3 GHz to 8 GHz:

RSA3308A: <-72 dBc (Ref Level = +5 dBm, RF Att. = 20 dB, total signal power = -7 dBm, signal separation 300 kHz).

Other-Input Related Spurious –

> 30 kHz offset – 70 dBc (Span = 2 MHz, Ref Level = 0 dBm, RBW = 50 kHz, Signal Level = -5 dBm, any center frequency).

Non-input Related Spurious –

(Ref = -30 dBm, RBW = 100 kHz, Span 3 GHz)

RSA3303A –

1 MHz to 20 MHz: -93 dBm.
 20 MHz to 3 GHz: -90 dBm.

RSA3308A –

1 MHz to 20 MHz: -93 dBm.
 20 MHz to 3.5 GHz: -90 dBm.
 3.5 GHz to 8 GHz: -85 dBm.

1 dB Gain Compression

RSA3303A, RSA3308A –

+2 dBm (RF ATT = 0 dB, 2 GHz).

Resolution Bandwidth Switching Uncertainty –

1 Hz to 10 MHz – ± 0.05 dB.

Reference Level –

Range – -51 to +30 dBm.

Resolution – 1 dB.

Accuracy – ±0.2 dB (-10 dBm to -50 dBm) at 50 MHz.

Display Scale Fidelity –

Log scale (max. cumulative), >0 dB to 50 dB – <±0.2 dB;

<±0.12 dB, typical at 0 dBm reference level.

Linear Scale – ±2% of Reference Level.

Linear to Log Scale Switching Uncertainty – 0.05%.

Amplitude Reference Output – -20 dBm, 50 MHz, internally switched to input.
